FINAL ASSIGNMENT

Final project: reproduce and explain

Required minimum and optional extras

Required

Run the supplied baseline.
Compare expected and observed results.
Complete every response/note.

Explain and hand over

Trace input → processing → output.
Keep a peer run record.
Explain one limitation.

Optional

Propose an improvement.
Rewrite or change a small part.
Use the supplied notebook form.

No code change, new feature or custom UI is required.

Begin with one visible planning example

Inputs

Bread and rice containers.
A supplied human-review flag.
A workload threshold.

Processing

Run plan_pickup.
Trace arithmetic and branches.
Keep the human-review gate.

Output

Read portions and label.
Compare with your prediction.
Explain what the result means.

An estimate is not a reservation, delivery or count of people served.

Where to work each week

Week	Required minimum	Optional
8	Identify the baseline flow and predict results.	Suggest an improvement.
9	Reproduce, compare and fill the notes.	Implement an approved change.
10	Demonstrate, hand over and explain.	Show the separate improvement.

No new research task is added in Weeks 8–10.

Compare the supplied full-system evidence

Measure	Expected planned portions	Interpretation
Offered	94	Opening declarations
Reserved	60	Accepted reservations
Collected	42	Explicit collection events
Delivered	29	Explicit delivery events

These overlapping lifecycle measures must not be added together.

Written responses are part of the minimum

Before running

Name the input and units.
Write the expected result.
Identify the processing rule.

After running

Record the observed result.
Explain a match or difference.
Complete each requested note.

Explain honestly

Name one limitation.
Separate simulation from reality.
“No code change” is valid.

Run all alone is not the complete submission; keep your own explanations.

Let a peer reproduce your result

Give

Known starting data.
Reset and run instructions.
Expected observations.

Observe

A peer follows the steps.
Record success or difficulty.
Answer a coordinator question.

Clarify

Improve confusing instructions
if needed, then rerun.
No code revision is required.

Keep the observation and an honest response, including when no change was needed.

If you choose an optional improvement

Choose a small scope

A clearer message or report.
One approved workload experiment.
A proposal alone is also optional.

Keep the baseline

Work in a separate copy.
Do not change human approval
or invent delivery evidence.

Check your change

Predict the changed result.
Preserve an unaffected case.
Explain and test your code.

Optional work is not needed for standard completion; no bonus value is promised.

Optional form, same function

Supplied

Notebook controls and button.
Input checks and display wiring.
You need not rebuild them.

Your understanding

The same function receives inputs.
It returns a result.
The form only displays it.

Plain fallback

Keep the switch off, or turn it off
if blank, text-only or unresponsive.
Use ordinary cells and print.

No server, installation, paid tool or API key is required for the minimum.

Save and submit the reproducible work

Include	Purpose
Notebook + fictional data	Reproduce the supplied baseline.
Completed notes	Show predictions, observations and explanation.
Run guide + evidence	Let a peer repeat the result.
Individual explanation	Trace a result and state a limitation.
Optional work, if any	Clearly separate proposals or changed code.

Submit to submit.progmis@gmail.com and keep a separate backup.

Assessment and remaining announcements

Minimum evidence

Reproduction and checked results.
Completed written responses.
Handoff and individual understanding.

Optional

Improvement proposals.
Code rewrites or new features.
The notebook form.

Still to be announced

Numeric split within proposed 30%.
Dates, teams and presentation slots.
Exact submission file name.

An unchanged reproduced baseline can meet the standard requirements.
